

The **skmath** package^{*†}

Simon Sigurdhsson [sigurdhsson@gmail.com]

Version 0.1e

Abstract The skmath package provides improved and new math commands for superior typesetting with less effort.

1 Introduction

This package intends to provide helpful (re-)definitions of commands related to typesetting mathematics, and specifically typesetting them in a more intuitive, less verbose and more beautiful way. It was originally not intended for use by the public, and as such there may be incompatibilities with other packages of which I am not aware, but I figured it could be useful to other people as well.

2 Usage

2.1 Options

As of version v0.1e, there is only one option: `commonsets`. By default, it is disabled but if the option is given the package will define `\N`, `\Z`, `\Q`, `\R` and `\C` as blackboard variants of the respective letters, to represent the common sets of numbers.

^{*}Available on <http://www.ctan.org/pkg/skbundle>.

[†]Development version available on <https://github.com/urdh/skmath>.

2.2 New commands

The package defines a number of new commands that aid in typesetting certain mathematical formulae.

`\R`

These commands are only available if the `commonsets` option is given. They typeset the set of natural, integer, rational, real and complex numbers respectively.

Example:

$$\mathbb{N}, \mathbb{Z}, \mathbb{Q}, \mathbb{R}, \mathbb{C}.$$

`\norm` $\{\langle expression \rangle\}$
`\abs` $\{\langle expression \rangle\}$

The commands `\norm` and `\abs`, quite expectedly, typeset the norm and absolute value of an expression, respectively. They have one mandatory argument (the expression), and different norms can be achieved by appending a subscript after the argument of `\norm`.

Example:

$$\|x\|_p = \left(\sum_{i=1}^n |x_i|^p \right)^{1/p}$$

`\d` $\{\langle variable \rangle\}$

There is also a command `\d`, with one mandatory argument, that typesets the differential part of an integral.

Example:

$$\int_{\mathbb{R}} \frac{\sin(x)}{x} dx$$

`\E` $\{\langle expression \rangle\}$

The command `\E` typesets the expectation of a random variable.

Example:

$$E[\hat{\mu}] = \mu$$

`\P` $\{\langle expression \rangle \backslash given \langle expression \rangle\}$

The `\P` command typesets a probability. The `\given` command can be used to typeset conditional probabilities, within `\P`.

Example:

$$P(A | B) = \frac{P(B | A) P(A)}{P(B)}$$

`\var` $\{\langle expression \rangle\}$

`\cov` $\{\langle expression \rangle\}\{\langle expression \rangle\}$

The commands `\var` and `\cov` typeset the variance and covariance of an expression.

Example:

$$\begin{aligned} \text{Var}(X) &= E[(X - \mu)^2] \\ \text{Cov}(X, Y) &= E[XY] - E[X]E[Y] \end{aligned}$$

2.3 Improved commands

In addition to adding new commands, this package also redefines already existing commands in a mostly backwards-compatible way to improve their usefulness.

`\arcsin` [*power*] {*expression*} {*expression*}
`\arccos` [*power*] {*expression*} {*expression*}
`\arctan` [*power*] {*expression*} {*expression*}
`\cot` [*power*] {*expression*}

The trigonometric functions have been redefined to typeset more easily. They typeset *expression* as an argument of the expression, and (if applicable) *power* as a superscript between the function and its argument, e.g. $\sin^2(\phi)$.

`\ln` {*expression*}

The natural logarithm macro `\ln` has also been redefined to require an argument which is typeset as the argument of the logarithm.

`\log` [*base*] {*expression*}

The related macro `\log` is redefined in a similar way, but also accepts an optional argument denoting the base of the logarithm: $\log_2(x)$.

`\exp` {*expression*}

The exponential, `\exp`, is redefined to typeset its argument as a superscript of e in some display styles, and as an argument of `exp` otherwise:

$$e^{\sqrt{2} \exp(x)}$$

2.4 Stylistic changes

Some commands have been redefined in a completely backwards-compatible way to improve the end result of their typesetting.

`\frac` {*numerator*}{*denominator*}

The `\frac` command has been changed to improve typesetting, allowing `displaystyle` math in some settings.

`\bar` $\langle expression \rangle$ $\langle expression \rangle$

The `\bar` command has been changed to cover the entire $\langle expression \rangle$ (i.e. \overline{uv}), and `\vec` has been changed to match the `\vectorsym` command provided by `isomath`.

3 Implementation

The package implementation is very simple. First, we do the standard $\text{\LaTeX 2}_{\epsilon}$ preamble thing, then we require some dependencies.

```
(package) 1 \NeedsTeXFormat{LaTeX2e}[1999/12/01]
           2 \ProvidesPackage{skmath}%
           3 [2013/02/18 v0.1e skmath improved math commands]
           4 \RequirePackage{xparse}
           5 \PassOptionsToPackage{intlimits}{amsmath}
           6 \RequirePackage{kvoptions,amssymb,mathtools,xfrac,isomath}
```

We begin by declaring an option.

```
(package) 7 \SetupKeyvalOptions{family=skmath,prefix=skmath@}
           8 \DeclareBoolOption[false]{commonsets}
           9 \ProcessKeyvalOptions*
```

We optionally provide commands to typeset common sets.

```
(package) 10 \ifskmath@commonsets
```

`\N`(no arguments)

```
(package) 11 \NewDocumentCommand\N{}{\ensuremath{\mathbb{N}}}
```

`\Z`(no arguments)

```
(package) 12 \NewDocumentCommand\Z{}{\ensuremath{\mathbb{Z}}}
```

`\Q`(no arguments)

```
(package) 13 \NewDocumentCommand\Q{}{\ensuremath{\mathbb{Q}}}
```

`\R`(no arguments)

```
(package) 14 \NewDocumentCommand\R{}{\ensuremath{\mathbb{R}}}
```

\C(no arguments)

```
(package) 15 \NewDocumentCommand\C{}{\ensuremath{\mathbb{C}}}
```

```
(package) 16 \fi
```

This is followed by commands to typeset the norm and absolute value.

\abs(no arguments)

```
(package) 17 \DeclarePairedDelimiter\abs{\lvert}{\rvert}
```

\norm(no arguments)

```
(package) 18 \DeclarePairedDelimiter\norm{\lVert}{\rVert}
```

Next come the statistical commands.

\E(no arguments)

```
(package) 19 \DeclareDocumentCommand\E{m}{%
20   \ensuremath{\mathop{\mathrm{E}}\left[#1\right]}%
21 }
```

The **\P** command saves any old **\given** command, replacing it locally with the new **\given** command provided by the package.

\P(no arguments)

```
(package) 22 \DeclareDocumentCommand\P{m}{%
23   \ensuremath{\mathop{\mathrm{P}}\left(%
24     \let\skmath@given\given%
25     \right)%
```

\given (no arguments)

```
(package) 26 \DeclareDocumentCommand\given{}{\mid}%
```

```
(package) 27 #1%
28 \let\given\skmath@given%
29 \right)%
```

```

30 }%
31 }

```

\var(no arguments)

```

(package) 32 \DeclareDocumentCommand\var{m}{%
33 \ensuremath{\mathop{\mathrm{Var}}\left(\#1\right)}}%
34 }

```

\cov(no arguments)

```

(package) 35 \DeclareDocumentCommand\cov{mm}{%
36 \ensuremath{\mathop{\mathrm{Cov}}\left(\#1,\#2\right)}}%
37 }

```

We replace all trigonometric functions and some other common functions with alternatives that take an argument (or optionally, several arguments).

```

(package) 38 \let\skmath@sin\sin
39 \let\skmath@cos\cos
40 \let\skmath@tan\tan
41 \let\skmath@cot\cot
42 \let\skmath@arcsin\arcsin
43 \let\skmath@arccos\arccos
44 \let\skmath@arccos\arctan
45 \let\skmath@ln\log
46 \let\skmath@log\log
47 \let\skmath@exp\exp

```

\sin(no arguments)

```

(package) 48 \RenewDocumentCommand\sin{om}{%
49 \IfNoValueTF{#1}
50 {\ensuremath{\skmath@sin\left(\#2\right)}}
51 {\ensuremath{\skmath@sin^{\#1}\left(\#2\right)}}%
52 }

```

\cos(no arguments)

```

(package) 53 \RenewDocumentCommand\cos{om}{%
54 \IfNoValueTF{#1}
55 {\ensuremath{\skmath@cos\left(\#2\right)}}
56 {\ensuremath{\skmath@cos^{\#1}\left(\#2\right)}}%
57 }

```

\backslash tan(no arguments)

```
(package) 58 \RenewDocumentCommand\tan{om}{%  
59 \IfNoValueTF{#1}  
60 { \ensuremath{\skmath@tan\left(#2\right)}}  
61 { \ensuremath{\skmath@tan^{#1}\left(#2\right)}}}%  
62 }
```

\backslash cot(no arguments)

```
(package) 63 \RenewDocumentCommand\cot{om}{%  
64 \IfNoValueTF{#1}  
65 { \ensuremath{\skmath@cot\left(#2\right)}}  
66 { \ensuremath{\skmath@cot^{#1}\left(#2\right)}}}%  
67 }
```

\backslash arcsin(no arguments)

```
(package) 68 \RenewDocumentCommand\arcsin{m}{%  
69 \ensuremath{\skmath@arcsin\left(#1\right)}}%  
70 }
```

\backslash arccos(no arguments)

```
(package) 71 \RenewDocumentCommand\arccos{m}{%  
72 \ensuremath{\skmath@arccos\left(#1\right)}}%  
73 }
```

\backslash arctan(no arguments)

```
(package) 74 \RenewDocumentCommand\arctan{m}{%  
75 \ensuremath{\skmath@arctan\left(#1\right)}}%  
76 }
```

\backslash ln(no arguments)

```
(package) 77 \RenewDocumentCommand\ln{m}{%  
78 \ensuremath{\skmath@ln\left(#1\right)}}%  
79 }
```

\backslash log(no arguments)

```
(package) 80 \RenewDocumentCommand\log{om}{%
```

```

81 \IfNoValueTF{#1}
82   {\ensuremath{\skmath@log\left(#2\right)}}
83   {\ensuremath{\skmath@log_{#1}\left(#2\right)}}}%
84 }

```

$\backslash\exp$ (no arguments)

```

(package) 85 \RenewDocumentCommand\exp{m}{\ensuremath{\mathchoice%
86   {e^{#1}}%
87   {\skmath@exp\left(#1\right)}}%
88   {\skmath@exp\left(#1\right)}}%
89   {\skmath@exp\left(#1\right)}}%
90 }

```

The fraction command is modified to improve typesetting.

\backslashfrac (no arguments)

```

(package) 91 \RenewDocumentCommand\frac{mm}{\genfrac{}{}{}{}%
92   {\displaystyle #1}{\displaystyle #2}}

```

The \backslashbar command is also modified to improve typesetting.

\backslashbar (no arguments)

```

(package) 93 \RenewDocumentCommand\bar{m}{%
94   \ensuremath{\mkern 1.5mu\overline{\mkern-1.5mu{#1}\mkern-1.5mu}\mkern 1.5mu}}

```

We introduce a command to typeset the differential part of integrals, shamefully stolen from an answer on T_EX.SE. Definition is deferred until after all packages are loaded to avoid collisions with other $\backslash d$ commands.

```

(package) 95 \AtBeginDocument{%

```

$\backslash d$ (no arguments)

```

(package) 96 \DeclareDocumentCommand\d{m}{\ensuremath{\backslash,\mathrm{d}}#1%
97   \@ifnextchar\d{\!}{}}

```

```

(package) 98 }

```

Finally, we define a nicer way to denote vectors.

\backslashvec (no arguments)

`\let\vec\vectorssym`

`\endinput`

4 Changes

v0.1

General: Initial version.

`\R`: Moved to xparse command definition.

v0.1a

`\Z`: Moved to xparse command definition.

`\d`: Fixed obtuse errors.

v0.1c

v0.1b

General: Moved package from docstrip to skdoc.

General: Load amsmath with `intlimits` option.

`\bar`: Added `\bar` replacement.

v0.1d

`\C`: Moved to xparse command definition.

General: Fixed fatal documentation and package errors.

`\d`: Moved to xparse command definition.

v0.1e

`\exp`: Moved to xparse command definition.

General: Added statistics commands.

`\frac`: Moved to xparse command definition.

`\cov`: Added `\cov` command.

`\N`: Moved to xparse command definition.

`\E`: Added `\E` command.

`\Q`: Moved to xparse command definition.

`\given`: Added `\given` command.

`\P`: Added `\P` command.

`\var`: Added `\var` command.

5 Index

Numbers written in boldface refer to the page where the corresponding entry is described; numbers underlined refer to the page where the implementation of the corresponding entry is discussed. Numbers in roman refer to other mentions of the entry.
